## PARAT PRESENTS NEW TRANSPORT CONCEPT

### 360 DEGREES MOBILITY

Take a fresh look at tool transport: PARAT, a trendsetter of concepts for transporting and storing tools and sensitive devices, represents with the PARAMOVER® a system that takes practicability and ergonomics to a whole new level. The key feature of the PARAMOVER® is its three-fold handlebar that enables the fixed tool cases to be rotated through 360 degrees.

The new transport system consists of a trolley joined to a base case and two plates for attaching tool cases from the PARACTIVE series, which PARAT represented in spring. All elements are mounted to a high-strength, robust, lightweight aluminum bar. The anti-slip carrying handles with dimples make for easy and convenient transport of the trolley, even at construction sites, as do the smooth-running ball-bearing castors with 160mm diameter.

The core innovation of the PARAMOVER® is that all three system cases can be opened without interlocking them or removing them first. By unlocking the profile clamp that fixes each case carrier plate, the cases rotate 360 degrees around on the plates. This way, for instance, the top case can be opened, the central one rotates 180 degrees, and can also be opened as is the base case. This ensures that each tool and repair part can simultaneously be reached during assembly or on-site; no need to loosen the cases and interlock them again, remove them, or put them aside first. After the job is finished, the tool cases are pushed into the original position and securely interlocked again using the profile clamp – which ensures that they are not moved unintentionally when in the 180-degree position.

The lower fixed base of the PARAMOVER® provides a firm basis for the transport system in the truest sense and ensures extremely high stability, particularly in loaded conditions. Also, the case material is solid: The X-ABS-plastic is reinforced with a metal cage. This allows users to safely store even bulky tools and machines in the 48-liter storage compartment without risking damaging the case shell. Floor gliders on the base case guarantee that the PARAMOVER® does not scratch sensitive floors or surfaces.

In addition, the PARAMOVER® can have two PARACTIVE cases attached to it using the mounted case carrier plates. The tool cases come with specially designed floor gliders for easy mounting on the carrier plates and are securely fixed with the integrated interlocking mechanism. The cases from the new PARACTIVE series are also made from robust X-ABS plastic and can be individually equipped. PARAT offers cases in two versions with various interiors: one with sewn separations for classic tool storage, and another with the exclusive CP-7 tool holder system with secure push-in fastening. Further customization options are available for creating individual interior designs - a service PARAT provides as a manufacturer following customer requirements.

The striking design and the characteristic black-red color scheme of the PARAMOVER® in combination with the PARACTIVE cases ensure a modern and representable appearance. Whether fitter, technician, or craftsman: This way, expertise can already be seen in your equipment.

The PARAMOVER® will be available from September 2024 and comes in four versions: a basic version without additional cases and three other versions with different case configurations. The system can gradually be expanded and adapted to specific applications. PARAT boasts a great deal of experience in developing customer-specific solutions.
